

Data Intern Assignment – 2024-25

Q1. You are provided with three datasets: Raw Data, Category and Gender Master, and Pincode Master. Analyze the Raw Data thoroughly and use the other two files in Excel to answer the following:

1. Which state and city recorded the highest and lowest quantities sold?
2. Which Category Gender generated the second highest sales?
3. What are the most popular sizes sold?
4. How many stores we currently have and in which cities?
5. The company plans to expand its offline presence by opening new retail stores in untapped territories. How can we identify cities with the potential for new stores? Based on your analysis, which cities should be considered? (Feel free to propose your own criteria and can also use the provided data to support your recommendations.)

Q2. Let's Consider These Provided Excel Files as Individual Tables in A MySQL Server, hypothetically. Write Queries which can give as the result.

1. Calculate the total quantity sold (Qty) for each state and city. Identify the states and cities with the highest and lowest quantities sold.
2. Join the Raw Data with the Category and Gender Master table. Determine which Category and Gender combination generated the highest sales (sum of ListPrice * Qty).
3. Write a query to find the ParentProduct with the highest number of orders in the top 3 cities by total sales (based on Pincode Master data).

Q3. Please use this data to conduct any additional analysis beyond what has already been mentioned. Feel free to explore unconventional or out-of-the-box insights—anything that can add unique value. We will be discussing this further if you're selected for the next round of interviews.
